

1. To move files between Colab and GitHub by doing File, Save a copy in GitHub. The repo needs to be public for the connection to work, and you specify the exact file path when saving so it goes to the right place.
2. No, I hit a few name error issues where imports like pandas, and LinearRegression. Once I added the missing imports it worked fine.
3. I used a GitHub Codespace terminal to structure the repo, creating separate HW1/HW2/HW3 folders with git add, commit, and push to track them.
4. Machine learning libraries are built around core Python structures like arrays, DataFrames, indexing, functions. If you struggle with the basics, you end up debugging syntax instead of understanding the actual logic. A solid foundation lets you focus on what the algorithm is doing.
